# Problem Statement

Adventure Works is a global bicycle manufacturing company selling bikes, accessories, and apparel across multiple regions including North America, Europe, and the Pacific.

As the company expanded internationally, leadership began facing several challenges. Sales and return data existed across multiple systems, making it difficult for executives to quickly understand overall business performance. Decision-makers lacked a centralized view of revenue trends, product performance, customer behaviour, and regional sales distribution.

Additionally, the company struggled to identify which products were driving growth, which customer segments were most valuable, and where return rates were impacting profitability. Without clear insights and forecasting capabilities, planning inventory, optimizing pricing, and improving marketing strategies became increasingly difficult.

To address these challenges, a unified analytics solution was required that could provide leadership with a single, reliable view of the company's financial performance, operational metrics, and growth opportunities.

# Objectives

The Power BI dashboard was designed to help executives and business teams answer critical business questions and support data-driven decision making.

The key objectives were:

1. Monitor Overall Business Performance
Provide executives with a real-time overview of revenue, profit, orders, and return rates to quickly assess the health of the business.

2. Identify Product Performance Trends
Help product and sales teams understand which products and categories generate the most orders and revenue.

3. Track Regional Sales Distribution
Enable leadership to analyze geographic performance and identify high-performing markets and expansion opportunities.

4. Understand Customer Behaviour and Value
Provide insights into customer purchasing patterns, high-value customers, and average revenue per customer.

5. Detect Operational Risks
Identify products with high return rates that could indicate quality issues or customer dissatisfaction.

6. Support Strategic Planning Through Forecasting
Use historical trends and forecasting to help executives anticipate future revenue growth and prepare inventory and supply chain strategies accordingly.

# Solution Approach

To solve the company's visibility and decision-making challenges, I developed a multi-page Power BI dashboard that provides both executive-level summaries and detailed operational insights.

## Executive Summary

The Executive Summary page gives leadership a high-level overview of business health through KPIs such as revenue, profit, orders, and return rates. Trend analysis and forecasting help executives quickly understand whether the business is growing and what the future trajectory might look like.

## Map

The Map page provides geographic insights by visualizing sales performance across different regions. This helps leadership identify top markets and potential expansion opportunities.

## Product Details

The Product Details page focuses on product performance, allowing teams to analyze order volumes, profit trends, and return percentages. Interactive controls enable business users to simulate pricing adjustments and observe potential profit impacts.

## Customer Details

The Customer Details page provides deep insights into customer behavior, highlighting high-value customers, revenue contribution, and purchasing patterns. This allows marketing and sales teams to focus on retaining and nurturing profitable customer segments.

Together, these pages create a unified analytics environment where executives, sales teams, marketing teams, and supply chain managers can all access the insights they need to make better decisions.

# Business Impact

This dashboard delivers significant value by transforming raw sales and return data into actionable business insights.

Executives gain a single source of truth for business performance, allowing them to monitor growth, profitability, and operational risks in real time.

Sales and marketing teams can identify high-performing products and valuable customer segments, enabling them to design targeted campaigns that increase revenue and customer retention.

Product and supply chain teams can monitor return patterns and product demand, helping them optimize inventory management and address quality issues proactively.

The inclusion of trend analysis and forecasting allows leadership to anticipate future demand, improving strategic planning and reducing the risk of stock shortages or overproduction.

Overall, the solution improves data visibility, decision-making speed, and operational efficiency, enabling the company to scale its global operations with greater confidence and precision.
